5.12. De Bruijn Sequence

```
1   // We can solve this problem by constructing a directed graph with
2   // k^(n-1) nodes with each node having k outgoing edges_order. Each node
        corresponds to a string of size n-1. Every edge corresponds to one of the
        k
4   // characters in A and adds that character to the starting string. For
        example,
5   // if n=3 and k=2, then we construct the following graph:
6
7   //            - 1 ->  (01)  - 1 ->
```

```
//           /         ^  |        \
// 0 -> (00)          1  0          (11) <- 1
//          \          |  v         /
//           <- 0 -   (10)  <- 0 -

// The node '01' is connected to node '11' through edge '1', as adding '1' to
// '01' (and removing the first character) gives us '11'.
//
// We can observe that every node in this graph has equal in-degree and
// out-degree, which means that a Eulerian circuit exists in this graph.

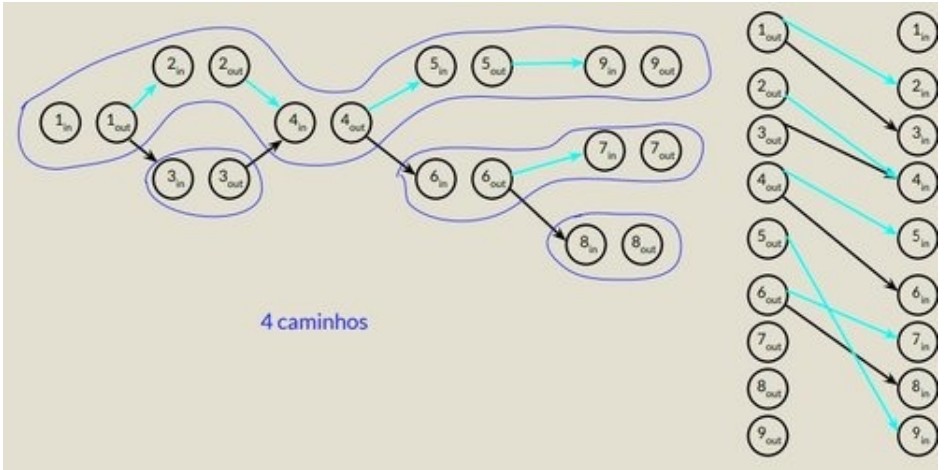
5.28. Minimum Edge Cover (Set Of Edges That Are Adjacent To All Vertices)

```
|E minimal| = |V| - MAXIMUM_MATCHING
```

5.29. Minimum Path Cover In Dag



5.30. Minimum Path Cover In Dag

```
Given the paths we can split the vertices into two different vertices: IN
    and OUT. Then, we can build a bipartite graph in which the OUT vertices
    are present on the left side of the graph and the IN vertices on the
    right side. After that, we create an edge between a vertex on the left
```

```
    side to the right side if there's a connection between them in the
    original graph.
The answer at the end will be equal to |V| - MAXIMUM_MATCHING, because the
    OUT vertices in which don't have a match represent the end of a path.
```

5.31. Mst

```
/// Requires DSU.cpp
struct edge {
  int u, v, w;
  edge() {}
  edge(int u, int v, int w) : u(u), v(v), w(w) {}

  bool operator<(const edge &a) const { return w < a.w; }
};

/// Returns weight of the minimum spanning tree of the graph.
///
/// Time Complexity: O(V log V)
int kruskal(int n, vector<edge> &edges) {
  DSU dsu(n);
  sort(edges.begin(), edges.end());

  int weight = 0;
  for (int i = 0; i < edges.size(); i++) {
    if (dsu.Union(edges[i].u, edges[i].v)) {
      weight += edges[i].w;
    }
  }

  return weight;
}
```

5.32. Number Of Different Spanning Trees In A Complete Graph

```
Cayley's formula

n ^ (n - 2)
```

5.33. Number Of Ways To Make A Graph Connected

```
s_{1} * s_{2} * s_{3} * (...) * s_{k} * (n ^ (k - 2))
n = number of vertices
s_{i} = size of the i-th connected component
k = number of connected components
```

5.34. Pruffer Decode

```
// IT MUST BE INDEXED BY 0.
/// Returns the adjacency matrix of the decoded tree.
///
/// Time Complexity: O(V)
vector<vector<int>> pruefer_decode(const vector<int> &code) {

  int n = code.size() + 2;
  vector<vector<int>> adj = vector<vector<int>>(n, vector<int>());
  vector<int> degree(n, 1);

    }
  }
  adj[n - 1].push_back(nxt);
  adj[nxt].push_back(n - 1);

  return adj;
}
```

5.35. Pruffer Encode

```
void dfs(int v, const vector<vector<int>> &adj, vector<int> &parent) {
  for (int u : adj[v]) {
    if (u != parent[v]) {
      parent[u] = v;
      dfs(u, adj, parent);
    }
  }
}

// IT MUST BE INDEXED BY 0.
/// Returns prueffer code of the tree.
///
/// Time Complexity: O(V)
vector<int> pruefer_code(const vector<vector<int>> &adj) {
  int n = adj.size();
  vector<int> parent(n);
  parent[n - 1] = -1;
  dfs(n - 1, adj, parent);

  int ptr = -1;
  vector<int> degree(n);
  for (int i = 0; i < n; i++) {
    degree[i] = adj[i].size();
    if (degree[i] == 1 && ptr == -1)
      ptr = i;
  }

  vector<int> code(n - 2);
  int leaf = ptr;
  for (int i = 0; i < n - 2; i++) {
    int next = parent[leaf];
    code[i] = next;
    if (--degree[next] == 1 && next < ptr)
      leaf = next;
    else {
      ptr++;
      while (degree[ptr] != 1)
        ptr++;
      leaf = ptr;
    }
```

```
  }

  return code;
}
```

5.36. Pruffer Properties

```
* After constructing the Prüfer code two vertices will remain. One of them
    is the highest vertex n-1, but nothing else can be said about the other
    one.
* Each vertex appears in the Prüfer code exactly a fixed number of times -
    its degree minus one. This can be easily checked, since the degree will
    get smaller every time we record its label in the code, and we remove it
    once the degree is 1. For the two remaining vertices this fact is also
    true.
```

5.37. Remove All Bridges From Graph

```
1. Start a DFS and store the leafs in an array.
2. Connect the first leaf vertex in the array with the one in the middle,
   the second one and the middle + 1, and so on.
```

5.38. Scc (Kosaraju)

```
class SCC {
private:
  // number of vertices
  int n;
  // indicates whether it is indexed from 0 or 1
  int indexed_from;
  // reversed graph
  vector<vector<int>> trans;

  return false;
}
} // namespace tree
```

6. Language Stuff

6.1. Binary String To Int

```
int y = bitset<number_of_bits>(string_var).to_ulong();
Ex : x = 1010, number_of_bits = 32;
y = bitset<32>(x).to_ulong(); // y = 10
```

6.2. Check Char Type

```
#include <cctype>
isdigit(str[i]); // check if it's a number
isalpha(str[i]); // check if it's a letter
islower(str[i]); // check if it's lowercase
isupper(str[i]); // check if it's uppercase
isalnum(str[i]); // check if it's a number or letter
tolower(str[i]); // converts to lowercase
toupper(str[i]); // converts to uppercase
```

6.3. Check Overflow

```
bool __builtin_add_overflow (type1 a, type2 b, type3 *res)
bool __builtin_sadd_overflow (int a, int b, int *res)
bool __builtin_saddl_overflow (long int a, long int b, long int *res)
bool __builtin_saddll_overflow (long long int a, long long int b, long long
    int *res)
bool __builtin_uadd_overflow (unsigned int a, unsigned int b, unsigned int
    *res)
bool __builtin_uaddl_overflow (unsigned long int a, unsigned long int b,
    unsigned long int *res)
bool __builtin_uaddll_overflow (unsigned long long int a, unsigned long long
    int b, unsigned long long int *res)

bool __builtin_sub_overflow (type1 a, type2 b, type3 *res)
bool __builtin_ssub_overflow (int a, int b, int *res)
bool __builtin_ssubl_overflow (long int a, long int b, long int *res)
bool __builtin_ssubll_overflow (long long int a, long long int b, long long
    int *res)
bool __builtin_usub_overflow (unsigned int a, unsigned int b, unsigned int
    *res)
bool __builtin_usubl_overflow (unsigned long int a, unsigned long int b,
    unsigned long int *res)
bool __builtin_usubll_overflow (unsigned long long int a, unsigned long long
    int b, unsigned long long int *res)

bool __builtin_mul_overflow (type1 a, type2 b, type3 *res)
bool __builtin_smul_overflow (int a, int b, int *res)
bool __builtin_smull_overflow (long int a, long int b, long int *res)
bool __builtin_smulll_overflow (long long int a, long long int b, long long
    int *res)
bool __builtin_umul_overflow (unsigned int a, unsigned int b, unsigned int
    *res)
bool __builtin_umull_overflow (unsigned long int a, unsigned long int b,
    unsigned long int *res)
bool __builtin_umulll_overflow (unsigned long long int a, unsigned long long
    int b, unsigned long long int *res)
```

6.4. Counting Bits

```
#pragma GCC target ("sse4.2")
// Use the pragma above to optimize the time complexity to O(1)
__builtin_popcount(int) -> Number of active bits
__builtin_popcountll(ll) -> Number of active bits
__builtin_ctz(int) -> Number of trailing zeros in binary representation
__builtin_clz(int) -> Number of leading zeros in binary representation
__builtin_parity(int) -> Parity of the number of bits
```

6.5. Gen Random Numbers (Rng)

```
mt19937 rng(chrono::steady_clock::now().time_since_epoch().count());
```

6.6. Int To Binary String

```
string s = bitset<number_of_bits>(intVar).to_string();
Ex : x = 10, number_of_bits = 32;
s = bitset<32>(x).to_string(); // s = 00...0001010
```

6.7. Int To String

```
int a;
string b = to_string(a);
```

6.8. Permutation

```cpp
int v[] = {1, 2, 3};
// The array must be sorted.
sort(v, v + 3);
do {
  cout << v[0] << ' ' << v[1] ' ' << v[2];
} while (next_permutation(v, v + 3));
```

6.9. Print Int128 T

```cpp
void print(__int128_t x) {
  if (x == 0)
    return void(cout << 0 << endl);
  bool neg = false;
  if (x < 0) {
    neg = true;
    x *= -1;
  }
  string ans;
  while (x) {
    ans += char(x % 10 + '0');
    x /= 10;
  }

  if (neg)
    ans += "-";
  reverse(all(ans));
  cout << ans << endl;
}
```

6.10. Read And Write From File

```cpp
freopen("filename.in", "r", stdin);
freopen("filename.out", "w", stdout);
```

6.11. Readint

```cpp
int readInt() {
  int a = 0;
  char c;
  while (!(c >= '0' && c <= '9'))
    c = getchar();
  while (c >= '0' && c <= '9')
    a = 10 * a + (c - '0'), c = getchar();
  return a;
}
```

6.12. Rotate Left

```cpp
vector<int> arr(n);                              // 1 2 3 4 5 6 7 8 9
rotate(arr.begin(), arr.begin() + 3, arr.end()); // 4 5 6 7 8 9 1 2 3
```

6.13. Rotate Right

```cpp
vector<int> arr(n);                                // 1 2 3 4 5 6 7 8 9
rotate(arr.begin(), arr.rbegin() + 3, arr.rend()); // 7 8 9 1 2 3 4 5 6
```

6.14. Scanf From String

```cpp
char sentence[] = "Rudolph is 12 years old";
char str[20];
int i;
sscanf(sentence, "%s %*s %d", str, &i);
printf("%s -> %d\n", str, i);
// Output: Rudolph -> 12
```

6.15. Split Function

```cpp
/// Splits a string into a vector. A separator can be specified
/// EX: str=A-B-C -> split -> x = {A,B,C}
///
/// Time Complexity: O(s.size())
vector<string> split(const string &s, char separator = ' ') {
  stringstream ss(s);
  string item;
  vector<string> tokens;
  while (getline(ss, item, separator))
    tokens.emplace_back(item);
  return tokens;
}
int main() {
  vector<string> x = split("cap-one-best-opinion-language", '-');
  // x = {cap,one,best,opinion,language};
}
```

6.16. String To Long Long

```cpp
string s = "0xFFFF";
int base = 16;
string::size_type sz = 0;
int ll = stoll(s, &sz, base);
// ll = 65535, sz = 6;
// if base is equal to 10 you may leave it empty.
// OBS: You can place anything (like 0) instead of sz stoll(s,0,base);
```

6.17. Substring

```cpp
string s = "abcdef";
// s.substr(first position, size);
string s2 = s.substr(3, 2); // s2 = "de"
// if the size is empty it takes the substring from first pos to the end
string s3 = s.substr(2); // s3 = "cdef"
```

6.18. Time Measure

```cpp
clock_t start = clock();

/* Execute the program */

clock_t end = clock();

double time_taken = double(end - start) / double(CLOCKS_PER_SEC);
```

6.19. Unique Vector

```cpp
sort(arr.begin(), arr.end());
arr.resize(unique(arr.begin(), arr.end()) - arr.begin());
```

6.20. Width

```cpp
cout << width(13);
cout << 100 << endl; // "     100      "
cout.fill('x');
cout.width(13);
cout << 100 << endl;          // "xxxxx100xxxxx"
cout << right << 100 << endl; // "xxxxxxx100"
```

7. Math

7.1. Bell Numbers

```cpp
/// Number of ways to partition a set.
/// For example, the set {a, b, c}.
/// It can be partitioned in five ways: {(a) (b) (c)},{(a, b), (c)},
/// {(a, c)(b)}, {(b, c), a}, {(a, b, c)}.
///
/// Time Complexity: O(n * n)
int bellNumber(int n) {
  int bell[n + 1][n + 1];
  bell[0][0] = 1;
  for (int i = 1; i <= n; i++) {
    bell[i][0] = bell[i - 1][i - 1];

    for (int j = 1; j <= i; j++)
      bell[i][j] = bell[i - 1][j - 1] + bell[i][j - 1];
  }
  return bell[n][0];
}
```

7.2. Binary Exponentiation

```cpp
int bin_pow(const int n, int p) {
  assert(p >= 0);
  int ans = 1;
  int cur_pow = n;

  while (p) {
    if (p & 1)
      ans = (ans * cur_pow) % MOD;

    cur_pow = (cur_pow * cur_pow) % MOD;
    p >>= 1;
  }

  return ans;
}
```

7.3. Chinese Remainder Theorem

```cpp
inline int mod(int x, const int MOD) {
  x %= MOD;
  if (x < 0)
    x += MOD;
  return x;
}

tuple<int, int, int> extended_gcd(int a, int b) {
  int x = 0, y = 1, x1 = 1, y1 = 0;
  while (a != 0) {
    const int q = b / a;
    tie(x, x1) = make_pair(x1, x - q * x1);
    tie(y, y1) = make_pair(y1, y - q * y1);
    tie(a, b) = make_pair(b % a, a);
  }
  return make_tuple(b, x, y);
}

/// USE __int128_t if LCM can get close to LLONG_MAX!!!
/// Returns the smallest number x such that:
/// x % num[0] = rem[0],
/// x % num[1] = rem[1],
/// ..................
/// x % num[n - 1] = rem[n - 1]
/// It also works when gcd(rem[i], rem[j]) != 1
///
/// Time Complexity: O(n*log(n))
int crt(vector<int> &rem, const vector<int> &md) {
  const int n = rem.size();
  for (int i = 0; i < n; i++)
    rem[i] = mod(rem[i], md[i]);
  int ans = rem.front(), LCM = md.front();
  for (int i = 1; i < n; i++) {
    int x, g;
    tie(g, x, ignore) = extended_gcd(LCM, md[i]);
    if ((rem[i] - ans) % g != 0)
      return -1;
    // the multiplication below may overflow if LCM can get close to
    LLONG_MAX
    // use __int128_t in this case
    ans =
        mod(ans + x * (rem[i] - ans) / g % (md[i] / g) * LCM, LCM / g *
    md[i]);
    // lcm of LCM, md[i]
    LCM = LCM / g * md[i];
  }
  return ans;
}
```

7.4. Combinatorics

```cpp
class Combinatorics {
private:
  static constexpr int MOD = 1e9 + 7;
  const int max_val;
  vector<int> _inv, _fat;

private:
  int mod(int x) {
    x %= MOD;
    if (x < 0)
      x += MOD;
    return x;
  }

    return mod(fat(n) * mod(inv(fat(k)) * inv(fat(n - k))));
  }
};
```

7.5. Diophantine Equation

```
int gcd(int a, int b, int &x, int &y) {
  if (a == 0) {
    x = 0;
    y = 1;
    return b;
  }
  int x1, y1;
  int d = gcd(b % a, a, x1, y1);
  x = y1 - (b / a) * x1;
  y = x1;
  return d;
}

bool diophantine(int a, int b, int c, int &x0, int &y0, int &g) {
  g = gcd(abs(a), abs(b), x0, y0);
  if (c % g)
    return false;

  x0 *= c / g;
  y0 *= c / g;
  if (a < 0)
    x0 = -x0;
  if (b < 0)
    y0 = -y0;
  return true;
}
```

7.6. Divide Fraction

```
/// Prints precision floating point places of a / b.
string divide(int a, int b, const int precision) {
  assert(a < b);
  string ans;
  for (int i = 0; i < precision; ++i) {
    a *= 10;
    ans += a / b + '0';
    a %= b;
  }
  return ans;
}
```

7.7. Divisors

```
/// OBS: Each number has at most ∛N divisors
/// THE NUMBERS ARE NOT SORTED!!!
///
/// Time Complexity: O(sqrt(n))
vector<int> divisors(int n) {
  vector<int> ans;
  for (int i = 1; i * i <= n; i++) {
    if (n % i == 0) {
      if (n / i == i)
        ans.emplace_back(i);
      else
        ans.emplace_back(i), ans.emplace_back(n / i);
    }
  }
  // sort(ans.begin(), ans.end());
  return ans;
}
```

7.8. Euler Totient

```cpp
/// Returns the amount of numbers less than or equal to n which are co-primes
/// to it.
int phi(int n) {
  int result = n;
  for (int i = 2; i * i <= n; i++) {
    if (n % i == 0) {
      while (n % i == 0)
        n /= i;
      result -= result / i;
    }
  }

  if (n > 1)
    result -= result / n;
  return result;
}
```

7.9. Extended Euclidean

```cpp
// Created by tysm.

/// Returns a tuple containing the gcd(a, b) and the roots for
/// a*x + b*y = gcd(a, b).
///
/// Time Complexity: O(log(min(a, b))).
tuple<int, int, int> extended_gcd(int a, int b) {
  int x = 0, y = 1, x1 = 1, y1 = 0;
  while (a != 0) {
    const int q = b / a;
    tie(x, x1) = make_pair(x1, x - q * x1);
    tie(y, y1) = make_pair(y1, y - q * y1);
    tie(a, b) = make_pair(b % a, a);
  }
  return make_tuple(b, x, y);
}
```

7.10. Factorization

```cpp
/// Factorizes a number.
///
/// Time Complexity: O(sqrt(n))
map<int, int> factorize(int n) {
  map<int, int> fat;
  while (n % 2 == 0) {
    ++fat[2];
    n /= 2;
  }

  for (int i = 3; i * i <= n; i += 2) {
    while (n % i == 0) {
      ++fat[i];
      n /= i;
    }
    /* OBS1
        IF(N < 1E7)
          you can optimize by factoring with SPF
    */
  }
  if (n > 2)
    ++fat[n];
  return fat;
}
```

7.11. Fft

```cpp
/// Code copied from:
///
    https://github.com/kth-competitive-programming/kactl/blob/08eb36f4bd9b8ce358e2f3f

```

7.24. Stars And Bars

I. positive integers x_i

For any pair of positive integers n and k, the number of distinct k-tuples of **positive integers** whose sum is n is given by the binomial coefficient

$$\binom{n-1}{k-1}.$$

In your case, $k = 4, n = 22$. So the number of distinct solutions (x_1, x_2, x_3, x_4) where the $x_i \in \mathbb{Z}, x_i > 0$ is given by

$$\binom{22-1}{4-1} = \binom{21}{3} = \frac{21!}{3!18!} = 1330$$

II. non-negative integers x_i

For any pair of natural numbers n and k, the number of distinct k-tuples of **non-negative integers** (which includes the possibility that one or more of the x_i are zero) whose sum is n is given by the binomial coefficient

$$\binom{n+k-1}{n} = \binom{n+k-1}{k-1}.$$

In your problem, $k = 4, n = 22$. Here, the distinct solutions (x_1, x_2, x_3, x_4) will include those from $I.$, but also allows 4-tuples in which one or more of the x_i are zero: $x_i \in \mathbb{Z}, x_i \geq 0$.

$$\binom{22+4-1}{22} = \binom{25}{22} = \frac{25!}{22!3!} = 2300$$

8. Miscellaneous

8.1. Counting Frequency Of Digits From 1 To K

```
def check(k):
  ans = [0] * 10
  for d in range(1, 10):
    pot = 10
    last = 1
    for i in range(20):
      v = (k // pot * last) + min(max(0, ((k % pot) - (last * d)) + 1), last)
      ans[d] += v
      pot *= 10
      last *= 10

  return ans
```

8.2. Counting Number Of Digits Up To N

```
int solve(int n) {
  int maxx = 9, minn = 1, dig = 1, ret = 0;
  for (int i = 1; i <= 17; i++) {
    int q = min(maxx, n);
    ret += max(0ll, (q - minn + 1) * dig);
    maxx = (maxx * 10 + 9), minn *= 10, dig++;
```

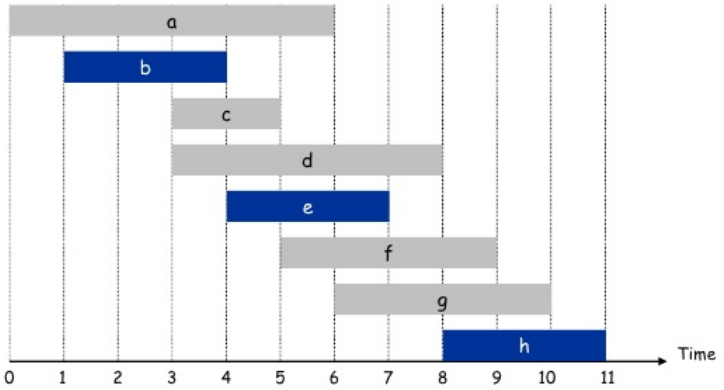
```
  }
  return ret;
}
```

8.3. Infix To Postfix

```
/// Code copied from:
/// https://www.geeksforgeeks.org/stack-set-2-infix-to-postfix/
/// Infix Expression | Prefix Expression | Postfix Expression
///      A + B       |     + A B         |       A B +
///    A + B * C     |    + A * B C      |     A B C * +
/// Time Complexity: O(n)
int infix_to_postfix(const string &infix) {
  map<char, int> prec;
  stack<char> op;
  string postfix;

  prec['+'] = prec['-'] = 1;
  prec['*'] = prec['/'] = 2;
  prec['^'] = 3;
  for (int i = 0; i < infix.size(); ++i) {
    char c = infix[i];
    if (is_digit(c)) {
      while (i < infix.size() && isdigit(infix[i])) {
        postfix += infix[i];
        ++i;
      }
      --i;
    } else if (isalpha(c))
      postfix += c;
    else if (c == '(')
      op.push('(');
    else if (c == ')') {
      while (!op.empty() && op.top() != '(') {
        postfix += op.top();
        op.pop();
      }
      op.pop();
    } else {
      while (!op.empty() && prec[op.top()] >= prec[c]) {
        postfix += op.top();
        op.pop();
      }
      op.push(c);
    }
  }
  while (!op.empty()) {
    postfix += op.top();
    op.pop();
  }
  return postfix;
}
```

8.4. Interval Scheduling



8.5. Interval Scheduling

```
1 -> Ordena pelo final do evento, depois pelo inicio.
2 -> Vai iterando pelos eventos, se eles não tiverem horário em comum então
     adiciona o evento à lista.
```

8.6. Iterate Over Subsets Of Mask

```
for (int j = mask; j > 0; j = (j - 1) & mask) {
}
```

8.7. Kadane

10.11. Z Function

```
// What is Z Array?
// For a string str[0..n-1], Z array is of same length as string.
// An element Z[i] of Z array stores length of the longest substring
// starting from str[i] which is also a prefix of str[0..n-1]. The
// first entry of Z array is meaning less as complete string is always
// prefix of itself.
// Example:
// Index
// 0   1   2   3   4   5   6   7   8   9  10  11
// Text
// a   a   b   c   a   a   b   x   a   a   a   z
// Z values
// X   1   0   0   3   1   0   0   2   2   1   0
// More Examples:
// str  = "aaaaaa"
// Z[]  = {x, 5, 4, 3, 2, 1}

// str = "aabaacd"
// Z[] = {x, 1, 0, 2, 1, 0, 0}

// str = "abababab"
// Z[] = {x, 0, 6, 0, 4, 0, 2, 0}
