2. Data Structures

2.1. Bit2D

```cpp
// INDEX BY ONE ALWAYS!!!
class BIT_2D {
 private:
  // row, column
  int n, m;
  vector<vector<int>> tree;

 private:
  // Returns an integer which constains only the least significant bit.
  int low(int i) {
    return i & (-i);
  }

  void bit_update(const int x, const int y, const int delta) {
    for(int i = x; i < n; i += low(i))
      for(int j = y; j < m; j += low(j))
        this->tree[i][j] += delta;
  }

  int bit_query(const int x, const int y) {
    int ans = 0;
    for(int i = x; i > 0; i -= low(i))
      for(int j = y; j > 0; j -= low(j))
        ans += this->tree[i][j];

    return ans;
  }

 public:
  // put the size of the array without 1 indexing.
  /// Time Complexity: O(n * m)
  BIT_2D(int n, int m) {
    this->n = n + 1;
    this->m = m + 1;

    this->tree.resize(n, vector<int>(m, 0));
```

```
  }

  /// Time Complexity: O(n * m * (log(n) + log(m)))
  BIT_2D(const vector<vector<int>> &mat) {
    // Check if it is 1 index.
    assert(mat[0][0] == 0);
    this->n = mat.size();
    this->m = mat.front().size();

    this->tree.resize(n, vector<int>(m, 0));
    for(int i = 1; i < n; i++)
      for(int j = 1; j < m; j++)
        update(i, j, mat[i][j]);
  }

  /// Query from (1, 1) to (x, y).
  ///
  /// Time Complexity: O(log(n) + log(m))

    bit_update(x, y, delta);
  }
};
```

2.2. Merge Sort Tree (K-Esimo Maior Elemento Num Intervalo, Valores Maiores Que K Num Intervalo,

```
// retornar a qtd de números maiores q um numero k numa array de i...j
struct Tree {
  vector<int> vet;
};
Tree tree[4*(int)3e4];
int arr[(int)5e4];

int query(int l,int r, int i, int j, int k, int pos) {
  if(l > j || r < i)
    return 0;

  if(i <= l && r <= j) {
    auto it = upper_bound(tree[pos].vet.begin(), tree[pos].vet.end(), k);
    return tree[pos].vet.end()-it;
  }

  int mid = (l+r)>>1;
  return query(l, mid, i, j, k, 2*pos+1) + query(mid+1,r,i,j,k,2*pos+2);
}

void build(int l, int r, int pos) {

  if(l == r) {
    tree[pos].vet.pb(arr[l]);
    return;
  }

  int mid = (l+r)>>1;
  build(l, mid, 2*pos+1);
  build(mid + 1, r, 2*pos+2);

  merge(tree[2*pos+1].vet.begin(), tree[2*pos+1].vet.end(),
    tree[2*pos+2].vet.begin(), tree[2*pos+2].vet.end(),
    back_inserter(tree[pos].vet));
}
```

2.3. Mos Algorithm

```
struct Tree {
  int l, r, ind;
};
Tree query[311111];
int arr[311111];
int freq[1111111];
int ans[311111];
int block = sqrt(n), cont = 0;

bool cmp(Tree a, Tree b) {
  if(a.l/block == b.l/block)
    return a.r < b.r;
  return a.l/block < b.l/block;
}

void add(int pos) {
  freq[arr[pos]]++;
  if(freq[arr[pos]] == 1) {
    cont++;
  }
}
void del(int pos) {
  freq[arr[pos]]--;
  if(freq[arr[pos]] == 0)
    cont--;
}
int main () {
  int n; cin >> n;
  block = sqrt(n);

  for(int i = 0; i < n; i++) {
    cin >> arr[i];
    freq[arr[i]] = 0;
  }

  int m;  cin >> m;

  for(int i = 0; i < m; i++) {
    cin >> query[i].l >> query[i].r;
    query[i].l--, query[i].r--;
```

```
    query[i].ind = i;
  }
  sort(query, query + m, cmp);

  int s,e;
  s = e = query[0].l;
  add(s);
  for(int i = 0; i < m; i++) {
    while(s > query[i].l)
      add(--s);
    while(s < query[i].l)
      del(s++);
    while(e < query[i].r)
      add(++e);
    while(e > query[i].r)
      del(e--);
    ans[query[i].ind] = cont;

  }
  for(int i = 0; i < m; i++)
    cout << ans[i] << endl;
}
```

2.4. Ordenacao De Estruturas (Pq, Etc)

```
struct cmp {
  bool operator(ii a, ii b) {
  //ordena primeiro pelo first(decrescente), dps pelo second(crescente)
    if(a.first == b.first)
      return a.second < b.second;
    return a.first > b.first;
  }
}
Ex: pq<ii,vector<ii>,cmp> fila;
```

2.5. Sqrt Decomposition

```
// Problem: Sum from l to r
// Ver MO'S ALGORITHM
// ------------------------------------
int getId(int indx,int blockSZ) {
    return indx/blockSZ;
}
void init(int sz) {
    for(int i=0; i<=sz; i++)
  BLOCK[i]=inf;
}
int query(int left, int right) {
int startBlockIndex=left/sqrt;
int endIBlockIndex = right / sqrt;
int sum = 0;
for (int i = startBlockIndex + 1; i < endIBlockIndex; i++) {
        sum += blockSums[i];
    }
for(i=left...(startBlockIndex*BLOCK_SIZE-1))
  sum += a[i];
for(j = endIBlockIndex*BLOCK_SIZE ... right)
  sum += a[i];
}
```

2.6. Bit

```
/// INDEX THE ARRAY BY 1!!!
class BIT {

5.10. De Bruijn Sequence

```
// We can solve this problem by constructing a directed graph with
// k^(n-1) nodes with each node having k outgoing edges_order. Each node
// corresponds to a string of size n-1. Every edge corresponds to one of the
    k
// characters in A and adds that character to the starting string. For
    example,
// if n=3 and k=2, then we construct the following graph:
//
//            - 1 ->  (01)  - 1 ->
//          /          ^  |        \
// 0 -> (00)          1  0          (11) <- 1
//          \          |  v         /
//           <- 0 -   (10)  <- 0 -
//
// The node '01' is connected to node '11' through edge '1', as adding '1' to
// '01' (and removing the first character) gives us '11'.
//
// We can observe that every node in this graph has equal in-degree and
// out-degree, which means that a Eulerian circuit exists in this graph.

  // }
  // cout << endl;

  return dp[n - 1];
}
```

5.19. Number Of Different Spanning Trees In A Complete Graph

```
Cayley's formula

n ^ (n - 2)
```

5.20. Number Of Ways To Make A Graph Connected

```
s_{1} * s_{2} * s_{3} * (...) * s_{k} * (n ^ (k - 2))
n = number of vertices
s_{i} = size of the i-th connected component
k = number of connected components
```

5.21. Pruffer Decode

```
// IT MUST BE INDEXED BY 0.
/// Returns the adjacency matrix of the decoded tree.
///
/// Time Complexity: O(V)
vector<vector<int>> pruefer_decode(const vector<int> &code) {

  int n = code.size() + 2;
  vector<vector<int>> adj = vector<vector<int>>(n, vector<int>());
  vector<int> degree(n, 1);
  for (int x : code)
    degree[x]++;

    }
  }
  adj[n - 1].push_back(nxt);
  adj[nxt].push_back(n - 1);

  return adj;
}
```

5.22. Pruffer Encode

```
void dfs(int v, const vector<vector<int>> &adj, vector<int> &parent) {
  for (int u : adj[v]) {
    if (u != parent[v]) {
      parent[u] = v;
      dfs(u, adj, parent);
    }
  }
}

// IT MUST BE INDEXED BY 0.
```

```cpp
/// Returns prueffer code of the tree.
///
/// Time Complexity: O(V)
vector<int> pruefer_code(const vector<vector<int>> &adj) {
  int n = adj.size();
  vector<int> parent(n);
  parent[n - 1] = -1;
  dfs(n - 1, adj, parent);

  int ptr = -1;
  vector<int> degree(n);
  for (int i = 0; i < n; i++) {
    degree[i] = adj[i].size();
    if (degree[i] == 1 && ptr == -1)
      ptr = i;
  }

  vector<int> code(n - 2);
  int leaf = ptr;
  for (int i = 0; i < n - 2; i++) {

    code[i] = next;
    if (--degree[next] == 1 && next < ptr)
      leaf = next;
    else {
      ptr++;
      while (degree[ptr] != 1)
        ptr++;
      leaf = ptr;
    }
  }

  return code;
}
```

5.23. Pruffer Properties

```
* After constructing the Prüfer code two vertices will remain. One of them
    is the highest vertex n-1, but nothing else can be said about the other
    one.
* Each vertex appears in the Prüfer code exactly a fixed number of times -
    its degree minus one. This can be easily checked, since the degree will
    get smaller every time we record its label in the code, and we remove it
    once the degree is 1. For the two remaining vertices this fact is also
    true.
```

5.24. Remove All Bridges From Graph

```
1. Start a DFS and store the leafs in an array.
2. Connect the first leaf vertex in the array with the one in the middle,
   the second one and the middle + 1, and so on.
```

5.25. Shortest Cycle In A Graph

```cpp
int bfs(int vt) {

  vector<int> dist(MAXN, INF);
  queue<pair<int, int>> q;

  q.emplace(vt, -1);
  dist[vt] = 0;

  int ans = INF;
  while (!q.empty()) {
    pair<int, int> aux = q.front();
    int u = aux.first, p = aux.second;
    q.pop();

    for (int v : adj[u]) {
      if (v == p)
        continue;
      if (dist[v] < INF)
        ans = min(ans, dist[u] + dist[v] + 1);
      else {
        dist[v] = dist[u] + 1;
        q.emplace(v, u);
      }
    }
  }

  return ans;
}

/// Returns the shortest cycle in the graph
///
/// Time Complexity: O(V^2)
int get_girth(int n) {
  int ans = INF;
  for (int u = 1; u <= n; u++)
    ans = min(ans, bfs(u));
  return ans;
}
```

5.26. Topological Sort

```cpp
/// INDEXED BY ZERO
///
/// Time Complexity: O(n)
vector<int> topological_sort(int n) {
  vector<int> in_degree(n, 0);

  for(int u = 0; u < n; u++)
    for(int v: adj[u])
      in_degree[v]++;

  queue<int> q;
  for(int i = 0; i < n; i++)
    if(in_degree[i] == 0)
      q.push(i);

  int cnt = 0;
  vector<int> top_order;
  while(!q.empty()) {
    int u = q.front();
    q.pop();

    top_order.push_back(u);
    cnt++;

    for(int v: adj[u])
      if(--in_degree[v] == 0)
        q.push(v);
  }

  if(cnt != n) {
    cerr << "There exists a cycle in the graph" << endl;
```

```
    return vector<int>();
  }

  return top_order;
}
```

5.27. Tree Distance

```
vector<pair<int, int>> sub(MAXN, pair<int, int>(0, 0));

void subu(int u, int p) {
  for (const pair<int, int> x : adj[u]) {
    int v = x.first, w = x.second;
    if (v == p)
      continue;
    subu(v, u);
    if (sub[v].first + w > sub[u].first) {
      swap(sub[u].first, sub[u].second);
      sub[u].first = sub[v].first + w;
    } else if (sub[v].first + w > sub[u].second) {
      sub[u].second = sub[v].first + w;
    }
  }
}

/// Contains the maximum distance to the node i
vector<int> ans(MAXN);

void dfs(int u, int d, int p) {
  ans[u] = max(d, sub[u].first);
  for (const pair<int, int> x : adj[u]) {
    int v = x.first, w = x.second;
    if (v == p)
      continue;
    if (sub[v].first + w == ans[u]) {

    } else {
      dfs(v, ans[u] + w, u);
    }
  }
}

// Returns the maximum tree distance
int solve() {
  subu(0, -1);
  dfs(0, 0, -1);
  return *max_element(ans.begin(), ans.end());
}
```

6. Language Stuff

6.1. Binary String To Int

```
int y = bitset<qtdDeBits>(stringVar).to_ulong();
Ex: x = 1010, qtdDeBits = 32;
y = bitset<32>(x).to_ulong(); // y = 10
```

6.2. Climits

```
LONG_MIN -> (-2^31+1) ::  LONG_MAX -> (2^31-1)
ULONG_MAX -> (2^32-1) -> UNSIGNED
LLONG_MIN, LLONG_MAX, ULLONG_MAX
```

6.3. Checagem Brute Force Com Solucao

```
$ g++ -std=c++11 gen.cpp && ./a.out > gen.out && g++ -std=c++11 brute.cpp &&
    (./a.out < gen.in) > brute.out && g++ -std=c++11 sol.cpp && (./a.out <
    gen.in) > sol.out && diff brute.out sol.out
```

6.4. Checagem De Bits

```
// OBS: SO FUNCIONA PARA INT (NAO FUNCIONA COM LONG LONG)
__builtin_popcount(int) -> Número de bits ativos;
__builtin_ctz(int) -> Número de zeros à direita
__builtin_clz(int) -> Número de zeros à esquerda
__builtin_parity(int) -> Retorna se a quantidade de uns é ímpar(1) ou par(0)
```

6.5. Checagem E Tranformacao De Caractere

```
#include <cctype>
isdigit(str[i]);//checa se str[i] é número
isalpha(str[i]);//checa se é uma letra
islower(str[i]);//checa minúsculo
isupper(str[i]);//checa maiúsculo
isalnum(str[i]);//checa letra ou número
tolower(str[i]);//converte para minusculo
toupper(str[i]);//converte para maiusculo
```

6.6. Conta Digitos 1 Ate N

```
int solve(int n) {

  int maxx = 9, minn = 1, dig = 1, ret = 0;

  for(int i = 1; i <= 17; i++) {
    int q = min(maxx, n);
    ret += max(0ll, (q - minn + 1) * dig);
    maxx = (maxx * 10 + 9), minn *= 10, dig++;
  }

  return ret;
}
```

6.7. Escrita Em Arquivo

```
ofstream cout("output.txt");
```

6.8. Gcd

```
int _gcd(int a, int b){
  if(a == 0 || b == 0) return 0;
  else return abs(__gcd(a,b));
}
```

6.9. Hipotenusa

```
cout << hypot(3,4); // output: 5
```

6.10. Int To Binary String

```
string s = bitset<qtdDeBits>(intVar).to_string();
Ex: x = 10, qtdDeBits = 32;
s = bitset<32>(x).to_string(); // s = 00...0001010
```

6.11. Int To String

```
int a; string b;
b = to_string(a);
```

6.12. Leitura De Arquivo

```
ifstream cin("input.txt");
```

6.13. Max E Min Element Num Vetor

```
int maior = *max_element(arr.begin(), arr.end());
int menor = *min_element(arr.begin(), arr.end());
// OBS: Retorna iterador
```

6.14. Permutacao

```
int v[] = {1,2,3};
sort(v, v+3);
do {
  cout << v[0] << ' ' << v[1] ' ' << v[2];
} while(next_permutation(v, v+3));
```

6.15. Printf De Uma String

```
char buffer [50];
int n, a=5, b=3;
n=sprintf (buffer, "%d plus %d is %d", a, b, a+b);
printf ("[%s] is a string %d chars long\n",buffer,n);
// Output:
// [5 plus 3 is 8] is a string 13 chars long
```

6.16. Remove Repeticoes Continuas Num Vetor

```
// arr = {10,20,20,20,30,20,20,10}
it = unique(arr.begin(), arr.end());
// arr = {10,20,30,20,10, iterator aponta pra aqui, ...}
arr.resize(distance(arr.begin(), it));
// arr = {10,20,30,20,10}
```

6.17. Rotate (Left)

```
Passado o inicio o meio e o fim ele rotaciona de forma que o meio seja o
    novo inicio.
vector<int> arr(n); // 1 2 3 4 5 6 7 8 9
rotate(arr.begin(),arr.begin()+3,arr.end()); //4 5 6 7 8 9 1 2 3
```

6.18. Rotate (Right)

```
vector<int> arr(n); // 1 2 3 4 5 6 7 8 9
rotate(arr.begin(),arr.rbegin()+3,arr.rend()); //7 8 9 1 2 3 4 5 6
```

6.19. Scanf De Uma String

```
char sentence[]="Rudolph is 12 years old";
char str [20]; int i;
sscanf (sentence,"%s %*s %d",str,&i);
printf ("%s -> %d\n",str,i);
// Output: Rudolph -> 12
```

6.20. Split Function

```
// SEPARA STRING POR UM DELIMITADOR
// EX: str=A-B-C split -> x = {A,B,C}
vector<string> split(const string &s, char delim) {
    stringstream ss(s);
    string item;
    vector<string> tokens;
    while (getline(ss, item, delim)) {
        tokens.push_back(item);
    }
    return tokens;
}
int main () {
  vector<string> x = split("cap-one-best-opinion-language", '-');
// x = {cap,one,best,opinion,language};
}
```

6.21. String To Long Long

```
string s = "0xFFFF"; int base = 16;
string::size_type sz = 0;
int ll = stoll(s,&sz,base); //  ll = 65535, sz = 6;
OBS: Não precisa colocar o sz, pode colocar 0; // stoll(s,0,base);
```

6.22. Substring

```
string s = "abcdef";
s.substr(posição inicial, qtd de char(opcional));
string s2 = s.substr(3,2); // s2 = "de"
string s3 = s.substr(2); // s3 = "cdef"
```

6.23. Width

```
cout << width(13);
cout << 100 << endl; // "     100      "
cout.fill('x');
cout.width(13);
cout << 100 << endl; // "xxxxx100xxxxx"
cout << right << 100 << endl; "xxxxxxx100"
```

6.24. Check Overflow

```
bool __builtin_add_overflow (type1 a, type2 b, type3 *res)
bool __builtin_sadd_overflow (int a, int b, int *res)
bool __builtin_saddl_overflow (long int a, long int b, long int *res)
bool __builtin_saddll_overflow (long long int a, long long int b, long long
    int *res)
bool __builtin_uadd_overflow (unsigned int a, unsigned int b, unsigned int
    *res)
bool __builtin_uaddl_overflow (unsigned long int a, unsigned long int b,
    unsigned long int *res)
```

```
bool __builtin_uaddll_overflow (unsigned long long int a, unsigned long long int b, unsigned long long int *res)

bool __builtin_sub_overflow (type1 a, type2 b, type3 *res)
bool __builtin_ssub_overflow (int a, int b, int *res)
bool __builtin_ssubl_overflow (long int a, long int b, long int *res)
bool __builtin_ssubll_overflow (long long int a, long long int b, long long int *res)

    }
  }
  return false;
}
```

8.3. Fibonacci Matrix Exponentiation

```
int fib (int n) {
  long long fib[2][2]= {{1,1},{1,0}};
  int ret[2][2]= {{1,0},{0,1}};
  int tmp[2][2]= {{0,0},{0,0}};
  int i,j,k;
  while(n) {
    if(n&1) {
      memset(tmp,0,sizeof tmp);
      for(i=0; i<2; i++)
        for(j=0; j<2; j++)
          for(k=0; k<2; k++)
            tmp[i][j]=(tmp[i][j]+ret[i][k]*fib[k][j]);
      for(i=0; i<2; i++)
        for(j=0; j<2; j++)
          ret[i][j]=tmp[i][j];
    }
    memset(tmp,0,sizeof tmp);
    for(i=0; i<2; i++)
      for(j=0; j<2; j++)
        for(k=0; k<2; k++)
          tmp[i][j]=(tmp[i][j]+fib[i][k]*fib[k][j]);
    for(i=0; i<2; i++)
      for(j=0; j<2; j++)
        fib[i][j]=tmp[i][j];
    n/=2;
  }
  return (ret[0][1]);
}
```

8.4. Infix To Prefix

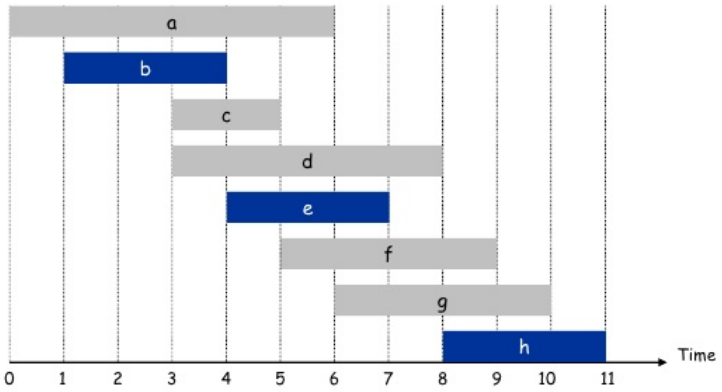
```
int main() {
map<char,int> prec;
stack<char> op;

string postfix;
string infix;
cin >> infix;

prec['+'] = prec['-'] = 1;
prec['*'] = prec['/'] = 2;
prec['^'] = 3;
for(int i = 0; i < infix.length(); i++) {
  char x = infix[i];
  if('0' <= x && x <= '9') {
    for(i;i < infix.length() && ('0' <= infix[i] && infix[i] <= '9');i++)
      postfix += infix[i];
    i--;
  } else if(('a' <= x && x <= 'z') || ('A' <= x && x <= 'Z')) {
    postfix += x;
  } else if (x == '(')
    op.push('(');
  else if(x == ')') {
    while(!op.empty() && op.top() != '(') {
      postfix += op.top();
      op.pop();
    }
    op.pop();
  } else {
    while(!op.empty() && prec[op.top()] >= prec[x]) {
    postfix += op.top();
    op.pop();
  }
  op.push(x);
  }
}
while(!op.empty()) {
postfix += op.top();
op.pop();
}
cout << postfix << endl;
}
```

8.5. Interval Scheduling

8.6. Interval Scheduling



```
1 -> Ordena pelo final do evento, depois pelo inicio.
2 -> Vai iterando pelos eventos, se eles não tiverem horário em comum então
     adiciona o evento à lista.
```

8.7. Kadane (Maior Soma Num Vetor)

```
int kadane(int arr[], int l) {

  int soma, total;
  soma = total = arr[0];

  for(int i = 1; i < l; i++) {
    soma = max(arr[i], arr[i] +soma);
    if(soma > total)
      total = soma;
  }
  return total;

}
```

8.8. Kadane 2D

```

// Program to find maximum sum subarray in a given 2D array
#include <stdio.h>
#include <string.h>
#include <limits.h>
int mat[1001][1001]
int ROW = 1000, COL = 1000;

// Implementation of Kadane's algorithm for 1D array. The function
// returns the maximum sum and stores starting and ending indexes of the
// maximum sum subarray at addresses pointed by start and finish pointers
// respectively.
int kadane(int* arr, int* start, int* finish, int n) {
    // initialize sum, maxSum and
    int sum = 0, maxSum = INT_MIN, i;

    // Just some initial value to check for all negative values case
    *finish = -1;

    // local variable
    int local_start = 0;

    for (i = 0; i < n; ++i) {

    tree[r].pref});
}
```

8.13. Largest Area In Histogram

```
/// Time Complexity: O(n)
int largest_area_in_histogram(vector<int> &arr) {
  arr.eb(0);

  stack<int> s;
  int ans = 0;
  for (int i = 0; i < arr.size(); ++i) {
    while (!s.empty() && arr[s.top()] >= arr[i]) {
      int height = arr[s.top()];
      s.pop();
      int l = (s.empty() ? 0 : s.top() + 1);
      // creates a rectangle from l to i - 1
      ans = max(ans, height * (i - l));
    }
    s.emplace(i);
  }
  return ans;
}
```

8.14. Point Compression

```
// map<int, int> rev;

/// Compress points in the array arr to the range [0..n-1].
///
/// Time Complexity: O(n log n)
vector<int> compress(vector<int> &arr) {
  vector<int> aux = arr;
  sort(aux.begin(), aux.end());
  aux.erase(unique(aux.begin(), aux.end()), aux.end());

  for (size_t i = 0; i < arr.size(); i++) {
    int id = lower_bound(aux.begin(), aux.end(), arr[i]) - aux.begin();
    // rev[id] = arr[i];
    arr[i] = id;
  }
  return arr;
}
```

9. Strings

9.1. Kmp

```
vector<int> pi(const string &s) {
  int n = s.size();
  vector<int> pi(n);

  int l = 0, r = 1;
  while (r < n) {
    if (s[l] == s[r]) {
      l++;
      pi[r] = l;
      r++;
    } else {
      if (l == 0) {
        pi[r] = 0;
        r++;
      } else
        l = pi[l - 1];
    }
  }
  return pi;
}

// returns the index of first occurence of a pat in a txt
int kmp(const string &txt, const string &pat) {
  int n = txt.size(), m = pat.size();

  int t = 0, p = 0;
  vector<int> pi_pat = pi(pat);
  // vector<int> occ;

  while (t < n) {

    if (txt[t] == pat[p]) {
      t++, p++;
      if (p == m) {
        return t - m;
        // if you want to continue searching
        // occ.pb(t - m);
        // p = pi_pat[p - 1];
      }
    } else {
```

```
      if (p == 0) {
        t++;
      } else {
        p = pi_pat[p - 1];
      }
    }
  }
  return -1;
  // return occ;
}
```

9.2. Trie - Maximum Xor Sum

```
// XOR(L,R) = XOR(1,L-1) ^ XOR(1,R)
ans= pre = 0
Trie.insert(0)
for i=1 to N:
    pre = pre XOR a[i]
    Trie.insert(pre)
    ans=max(ans, Trie.query(pre))
print ans

// a funcao query é a mesma da maximum xor between two elements
```

9.3. Trie - Maximum Xor Two Elements

```
1. Dada uma trie de números binários e um numero X, tente achar o número
    máximo que resultante da operação XOR

Ex: Para o número 10(=(1010)2), o número que resulta no xor máximo é (0101)2
    , tente acha-lo na trie.
```

9.4. Z-Function

```
// What is Z Array?
// For a string str[0..n-1], Z array is of same length as string.
// An element Z[i] of Z array stores length of the longest substring
// starting from str[i] which is also a prefix of str[0..n-1]. The
// first entry of Z array is meaning less as complete string is always
// prefix of itself.
// Example:
// Index
// 0   1   2   3   4   5   6   7   8   9  10  11
// Text
// a   a   b   c   a   a   b   x   a   a   a   z
// Z values
// X   1   0   0   3   1   0   0   2   2   1   0
// More Examples:
// str  = "aaaaaa"
// Z[]  = {x, 5, 4, 3, 2, 1}

// str = "aabaacd"
// Z[] = {x, 1, 0, 2, 1, 0, 0}

// str = "abababab"
// Z[] = {x, 0, 6, 0, 4, 0, 2, 0}

vector<int> z_function(const string &s) {
  vector<int> z(s.size());
  int l = -1, r = -1;
  for (int i = 1; i < s.size(); ++i) {
    z[i] = i >= r ? 0 : min(r - i, z[i - l]);
    while (i + z[i] < s.size() && s[i + z[i]] == s[z[i]])
      z[i]++;
    if (i + z[i] > r)
      l = i, r = i + z[i];
  }
  return z;
}
```

9.5. Aho Corasick

```
/// REQUIRES trie.cpp

class Aho {
